ABSTRACT

The Hydrographic system of the inland is influenced by various anthropogenic activities and interventions. The natural habitats undergo qualitative modifications, which combined with technical interventions, irrigation and drainage works, create idiomorphic ecosystems. This study examines the ecological quality of such systems based on the use of biotic indices (I.B.E., B.B.I., B.M.W.P., A.S.P.T. and B.M.W.P') together with richness, evenness, diversity and dominance ($\delta\%$) indices.
