### **ABSTRACT**

This paper is a summarized presentation of work published by the author during the last 25 years enriched with new information, and concerning land use. It consists of a number of quite original formulas (equations) that deal with this problem and give answers to some critical involving questions. These equations ensure objectivity because they are based on officially registered data, easily accessible and low in cost. Application trials have given a high degree of agreement (deviation < 1%) with results of other researchers, when they were based on land use questionnaires. Theoretically, the equations have a world wide application.
