### **ABSTRACT**

This paper presents data concerning the industrial wastewater produced and discharged in the Attika region, in the area of responsibility of EYDAP. More specifically, the parameters that relate to the type and number of controlled industries, the wastewater pre-treatment facilities and the quality of discharged effluents are examined. Major problems regarding industrial effluents management and control are identified and new possibilities and perspectives are pointed out so that EYDAP may contribute to the protection and safe operation of its sewerage system and the wastewater treatment plants and consequently to the protection of the environment as the ultimate recipient of effluents.
